A Brief Report on Clinical Aspects of Procrastination: Better Late than Never

Kathy Alberding, M.S.W., David Antonuccio, Ph.D., and Blake H. Tearman, Ph.D.
V.A. Medical Center, Reno

This is a brief report of a full-length article the authors are planning to write on the topic of procrastination as a mature psychological defense. The authors have not, however, had the time to do a thorough literature review, or any, for that matter, but all have experience with the topic and fully intend to do such a review in the near future.

There are several advantages of procrastination, not the least of which is that it allows an individual the opportunity to think a task through (D'Lay, in press). When the authors actually get around to writing the article, they expect to give it the thorough, detailed treatment this topic deserves.

Acknowledgments: The authors would like to extend their appreciation to those who expressed interest in contributing to this report but who never found sufficient time to do so: Patricia Chatham, Ph.D., Stephanie Dillon, Ph.D., William Danon, Ph.D., Norman Kerbel, M.B.A., Kathryn McFadden, M.S., David Hutchinson, M.D., Carol Vasso, and Julie Anderson.
